08

08 Compound has gained favour in Endurance Sportscar & GT racing and also in endurance production car racing due to its performance in applications where smooth initial bite is a must. 08 has a slight friction rise with temperature with excellent release and modulation characteristics. Very low abraded disc wear with a fine grey slate like disc finish, similar to 01. Despite its considerable performance, 08 wears the longest of all PFC pads and easily matches wear of the other competitors with much higher bite. If temperature is not an issue, 08 can be replaced with 12 compound. Typical applications: Endurance, GT and endurance production car racing, trackday.

11

11 Compound is a new generation sprint and medium distance friction providing the ultimate in control, with superior disc conditioning. 11 compound was developed from the 01 compound with improved bite, modulation, and release characteristics. It is ultra-smooth and developed to reduce wheel locking at the end of a stop. For many applications, 11 will replace the venerable 01 compound.

331

331 is the next generation of PFC endurance material. The 331 Carbon Metallic® compound has been developed with higher initial bite than PFC's renowned 08 endurance compound. The 331 has improved release, and continues to offer exceptional control and feel. The PFC 331 boasts low wear rate and exceptional disc conditioning.

332

332 has been formulated with lower bite and torque for rear applications. With smooth release, the 332 offers excellent stability and control. With exceptionally low wear rates, the 332 has been designed to work with ABS applications.
